

example 116: "conduit" cable steering system for a single rudder centre cockpit boat. The steering cable is guided by a teflon lined conduit outer cable. The conduit cable routing should have as few as possible curves and S curves should be avoided all times. Jefa Steering produces special articulated sheave sets and terminal units with adjustable sheave carriers and adjustable conduit brackets. This way the optimum routing can be achieved. The advisable maximum boatsize for this conduit system is around 50 foot. Above this length, the transmission system should be used.
